(57) **ABSTRACT**

A self-filling graduated cylinder system for efficiently filling a graduated cylinder with a chemical solution. The self-filling graduated cylinder system generally includes a graduated cylinder having an interior, an upper end, an upper opening in the upper end and a lower end opposite of the upper end, and a check valve attached to the graduated cylinder near the lower end of the graduated cylinder. The check valve is adapted to allow a liquid chemical to flow upwardly through the check valve into the graduated cylinder and to prevent the liquid chemical within the interior of the graduated cylinder from flowing downwardly through the check valve.

SELF-FILLING GRADUATED CYLINDER SYSTEM

CROSS REFERENCE TO RELATED APPLICATIONS

Not applicable to this application.

STATEMENT REGARDING FEDERALLY SPONSORED RESEARCH OR DEVELOPMENT

Not applicable to this application.

BACKGROUND

1. Field

Example embodiments in general relate to a self-filling graduated cylinder system for efficiently filling a graduated cylinder with a liquid chemical.

2. Related Art

Any discussion of the related art throughout the specification should in no way be considered as an admission that such related art is widely known or forms part of common general knowledge in the field.

In various industries, it is important to measure the volume of liquid chemical being used during a particularly period of time to ensure that the system is operating as intended. One example of an industry that will periodically check the liquid chemical usage in a period of time is the vehicle wash industry. In the vehicle wash industry, the operator of a vehicle wash will want to accurately measure the volume of liquid vehicle wash chemicals (e.g. presoaks, detergents, foaming solution, surface treatments, wax, clear coats, conditions, rinse, rust inhibitor, tire cleaner, degreaser, engine cleaner, etc.) used during a wash cycle to ensure that the proper amount of liquid chemical is being used during the wash cycle. Based on the measurement of liquid chemical used, the vehicle wash operator can then adjust the vehicle wash to increase, decrease or remain the same the usage of liquid chemical. While vehicle washes are used as an example, various other industries may benefit from the usage of the various embodiments shown herein.

In the vehicle wash industry, to measure the amount of liquid vehicle wash chemical used, the user removes a volume of the liquid vehicle wash chemical from a container (e.g. pump or other removal means) and dispenses the liquid vehicle wash chemical into a graduated cylinder. The user then inserts a chemical inlet line into the graduated cylinder to draw the liquid vehicle wash chemical from the graduated cylinder. The user then operates the vehicle wash with a single vehicle wash cycle or multiple vehicle wash cycles. The user determines how much liquid vehicle wash chemical was used per cycle by dividing the number of cycles into the volume of liquid vehicle wash chemical used. This data is then used to calibrate the vehicle wash. The user then pours the unused liquid vehicle wash chemical back into the original container.

SUMMARY

An example embodiment of the present invention is directed to a self-filling graduated cylinder system. The self-filling graduated cylinder system includes a graduated cylinder having an interior, an upper end, an upper opening in the upper end a lower end opposite of the upper end, and a check valve attached to the graduated cylinder near the lower end of the graduated cylinder. The check valve is

2

adapted to allow a liquid chemical to flow upwardly through the check valve into the graduated cylinder and to prevent the liquid chemical within the interior of the graduated cylinder from flowing downwardly through the check valve.

There has thus been outlined, rather broadly, some of the features of the self-filling graduated cylinder system in order that the detailed description thereof may be better understood, and in order that the present contribution to the art may be better appreciated. There are additional features of the self-filling graduated cylinder system that will be described hereinafter and that will form the subject matter of the claims appended hereto. In this respect, before explaining at least one embodiment of the self-filling graduated cylinder system in detail, it is to be understood that the self-filling graduated cylinder system is not limited in its application to the details of construction or to the arrangements of the components set forth in the following description or illustrated in the drawings. The self-filling graduated cylinder system is capable of other embodiments and of being practiced and carried out in various ways. Also, it is to be understood that the phraseology and terminology employed herein are for the purpose of the description and should not be regarded as limiting.

BRIEF DESCRIPTION OF THE DRAWINGS

Example embodiments will become more fully understood from the detailed description given herein below and the accompanying drawings, wherein like elements are represented by like reference characters, which are given by way of illustration only and thus are not limitative of the example embodiments herein.

FIG. 1 is an upper perspective view of a self-filling graduated cylinder in accordance with an example embodiment.

FIG. 2 is a lower perspective view of the self-filling graduated cylinder.

FIG. 3 is an exploded upper perspective view of the self-filling graduated cylinder.

FIG. 4 is a front view of the self-filling graduated cylinder.

FIG. 5 is a top view of the self-filling graduated cylinder.

FIG. 6 is a bottom view of the self-filling graduated cylinder.

FIG. 7 is a cross sectional view taken along line 7-7 of FIG. 5.

FIG. 8a is a front cross sectional view showing the self-filling graduated cylinder positioned above a chemical container.

FIG. 8b is a front cross sectional view showing the self-filling graduated cylinder positioned inside of the chemical container initially.

FIG. 8c is a front cross sectional view showing the self-filling graduated cylinder positioned inside of the chemical container showing the liquid chemical entering the interior of the graduated cylinder through the check valve.

FIG. 8d is a front cross sectional view showing the self-filling graduated cylinder positioned inside of the chemical container with the level of liquid chemical in the graduated cylinder equalized with the level of liquid chemical in the chemical tank.

FIG. 8e is a front cross sectional view showing the self-filling graduated cylinder removed from the chemical container and with the check valve retaining the liquid chemical within the graduated cylinder.

FIG. 9a is a front cross sectional view showing the self-filling graduated cylinder with a chemical inlet line

3

positioned within the graduated cylinder along with the marker moved to the initial chemical level in the graduated cylinder.

FIG. 9b is a front cross sectional view showing the self-filling graduated cylinder with the chemical inlet line positioned within the graduated cylinder with the liquid chemical level in the graduated cylinder lowered to a final chemical level in the graduated cylinder showing the volume of chemical used during the testing cycle(s).

FIG. 10 is an upper perspective view showing an alternative marker positioned upon the graduated cylinder.

FIG. 11 is an upper perspective view of a cleaning device attachable to the chemical container to clean the exterior of the graduated cylinder of the liquid chemical upon removal thereof from the chemical container.

FIG. 12 is a front cross sectional view showing the cleaning device attached to the chemical container with a clip device.

FIG. 13 is a front cross sectional view showing the cleaning device integrated into the ceiling of the chemical container.

FIG. 14 is an exploded upper perspective view of the graduated cylinder above a support stand to support the graduated cylinder in a vertical manner after removal from the chemical container.

FIG. 15 is an upper perspective view of another embodiment of the marker.

FIG. 16 is an upper perspective view of the valve unit for ball check valve.

FIG. 17 is a cross sectional view of the ball check valve in FIG. 16 illustrating the check ball.

DETAILED DESCRIPTION

A. Overview.

An example self-filling graduated cylinder system generally comprises a graduated cylinder 20 having an interior, an upper end 22, an upper opening 23 in the upper end 22 a lower end 24 opposite of the upper end 22, and a check valve 56 attached to the graduated cylinder 20 near the lower end 24 of the graduated cylinder 20. The check valve 56 is adapted to allow a liquid chemical 12 to flow upwardly through the check valve 56 into the graduated cylinder 20 and to prevent the liquid chemical 12 within the interior of the graduated cylinder 20 from flowing downwardly through the check valve 56.

B. Chemical Consuming Device.

The chemical consuming device 16 is preferably comprised of a vehicle wash used to wash vehicles (e.g. cars, trucks, semi-trucks, boats and the like). Various embodiments of the present invention are described herein as being used within the vehicle wash industry, but it can be appreciated that the embodiments of the present invention may be used in various other industries to measure liquid chemical 12 consumption and various other types of liquids other than vehicle wash chemicals. For example, the present invention may be used to measure the volume of oil used to lubricate a component of a machine used in manufacturing. As another alternative example, the present invention may be used to measure the volume of cooking oil used by an appliance during the cooking process of a food item. Various other chemical consuming devices 16 in various other industries may benefit from the various embodiments of the present invention.

C. Graduated Cylinder.

FIGS. 1 through 4 illustrate an exemplary embodiment of a graduated cylinder 20 for measuring a volume of liquid

4

chemical 12 consumption by the chemical consuming device 16. The graduated cylinder 20 has an interior to receive a volume of liquid chemical 12. The interior of the graduated cylinder 20 may hold various volumes of liquid chemical 12, such as, but not limited to, 10 ml, 25 ml, 50 ml or 100 ml. The graduated cylinder 20 may be constructed of various types of materials such as, but not limited to, glass or plastic.

The graduated cylinder 20 is not physically attached to the chemical container 10 used for the chemical consuming device 16 as the graduated cylinder 20 is a separate device used to be inserted into one or more chemical containers 10. The chemical containers 10 may be comprised of various structures such as a tank, a barrel with a ceiling 11 having an opening closable with a plug, a jug and the like. Examples of chemical containers 10 are containers used in vehicle washes to store liquid vehicle wash chemicals for usage by the vehicle wash. While not required, the various embodiments of the present invention are preferably used with respect to chemical containers 10 used in a vehicle wash. The chemical containers 10 used in a vehicle wash store various types of liquid chemicals 12 (e.g. presoaks, detergents, foaming solution, surface treatments, wax, clear coats, conditions, rinse, rust inhibitor, tire cleaner, degreaser, engine cleaner, etc.).

The graduated cylinder 20 is comprised of an elongated tubular structure having an upper end 22 and a lower end 24 opposing the upper end 22. The graduated cylinder 20 may have various lengths. The upper end 22 of the graduated cylinder 20 includes an upper opening 23 used for dispensing any remaining liquid chemical 12 in the graduated cylinder 20 back into the chemical container 10.

The graduated cylinder 20 preferably has a circular cross sectional shape forming a conventional cylinder shape. The graduated cylinder 20 has at least one sidewall and may have a plurality of sidewalls. However, the graduated cylinder 20 may have various other types of cross sectional shapes such as, but not limited to, oval, square, rectangular, triangular and the like.

At least a portion of the graduated cylinder 20 is preferably comprised of a transparent or semi-transparent material to allow for viewing of the liquid chemical 12 within the graduated cylinder 20. It is preferable that a substantial portion of the graduated cylinder 20 is comprised of a transparent or semi-transparent material, however, it is possible that a vertical strip is transparent (or semi-transparent) with the remaining portion opaque.

The graduated cylinder 20 preferably includes a plurality of line markings 30 that are horizontally orientated to indicate a volume of liquid chemical 12 in the graduated cylinder 20 at a certain location. The graduated cylinder 20 further preferably includes a plurality of measurement indicia 32 corresponding to the plurality of line markings 30 as shown in FIG. 4 of the drawings.

D. Check Valve.

A check valve 56 is attached to the graduated cylinder 20 near the lower end 24 of the graduated cylinder 20. The check valve 56 may be comprised of various types of valves that allow for the flow of liquid chemical 12 in one direction (sometimes referred to as a "one-way valve" or "free flow check valves 56"). In the various embodiments of the present invention, the check valve 56 is preferably adapted to allow for only the inward flow of liquid chemical 12 from outside of the graduated cylinder 20 into the interior of the graduated cylinder 20 to partially fill the graduated cylinder 20 (e.g. upwardly flow from the lower end 24; inward side flow if the check valve 56 is positioned on the sidewall of the graduated cylinder 20). When the graduated cylinder 20 is

5

removed from the chemical container 10, the check valve 56 prevents the outflow of the liquid chemical 12 in the interior of the graduated cylinder 20 to outside of the graduated cylinder 20.

In one embodiment, the check valve 56 is preferably adapted to allow the liquid chemical 12 from the chemical container 10 to flow upwardly through the check valve 56 into the graduated cylinder 20 when the lower end 24 of the graduated cylinder 20 is inserted below the upper level of the liquid chemical 12 in the chemical container 10 as illustrated in FIGS. 8b and 8c of the drawings. In this embodiment, the check valve 56 is further preferably adapted to prevent the liquid chemical 12 within the interior of the graduated cylinder 20 from flowing downwardly through the check valve 56.

The check valve 56 may be directly attached to the graduated cylinder 20 or the check valve 56 may be attached within a valve unit 50 that is attached to the graduated cylinder 20. The valve unit 50 includes a valve housing 52 surrounding at least a portion of the check valve 56 and an upper connecting end 54 that extends into the interior of the graduated cylinder 20. The upper connecting end 54 is narrower than the lower end 24 of the graduated cylinder 20 and frictionally extends into the opening in the lower end 24 of the graduated cylinder 20. The valve housing 52 is attached to the interior surface of the graduated cylinder 20.

The check valve 56 includes an inlet port 59 and an outlet port 58. The inlet port 59 is adapted to allow the liquid chemical 12 from outside of the graduated cylinder 20 to enter the check valve 56 and the outlet port 58 is adapted to allow the liquid chemical 12 to escape the check valve 56 into the interior of the graduated cylinder 20. FIG. 8c illustrates the liquid chemical 12 flowing upwardly into the inlet port 59 through the check valve 56 and continuing upwardly through the outlet port 58 into the interior of the graduated cylinder 20. The inlet port 59 and the outlet port 58 are preferably concentrically positioned with respect to the graduated cylinder 20, however, the ports 58, 59 may be offset or positioned within the sidewall of the graduated cylinder 20. The configuration of the check valve 56 in the figures is merely an example and is not intended to be limiting of the structure of the invention in any manner.

The check valve 56 may be comprised of various types of valves that allow for only one-way flow of liquid chemical 12. One example of a preferred check valve 56 is a diaphragm check valve 56 that uses a flexing rubber diaphragm positioned to create a normally-closed valve except when pressure from the upstream side exceeds the downstream side by a certain amount then the check valve 56 opens allowing for the flow of liquid chemical 12. The diaphragm closes when the positive pressure stops or falls below a certain level thereby returning to its original closed position.

Another preferably check valve 56 is comprised of a ball check valve 56. The ball check valve 56 includes a check ball 53 and a lower valve opening 57 as illustrated in FIG. 17 of the drawings. The check ball 53 is adapted to seal the lower valve opening 57 in the ball check valve 56 when liquid chemical 12 attempts to flow downwardly through the lower valve opening 57, and the check ball 53 is adapted to open the lower valve opening 57 in the ball check valve 56 when liquid chemical 12 attempts to flow upwardly through the lower valve opening 57. The ball check valve 56 operates in a manner similar to the diaphragm check valve 56 except that a check ball 53 is used instead of a diaphragm. The valve housing 52 preferably includes a tapered portion that tapers toward the lower valve opening 57 as shown in FIG. 17. The ball check valve 56 further preferably includes a ball

6

retainer 55 positioned above the lower valve opening 57 to prevent the check ball 53 from entering the graduated cylinder 20 when liquid chemical 12 is flowing into the graduated cylinder 20 as shown in FIG. 17. The ball retainer 55 is comprised of a permeable structure (e.g. screen). The ball check valve 56 preferably does not include a spring to bias the check ball 53 into the closed position, however, a spring may be used.

E. Marker.

One or more markers 40 are movably positioned upon an exterior of the graduated cylinder 20 to mark an initial chemical level in the graduated cylinder 20 as illustrated in FIGS. 1 through 10 and 15 of the drawings. The marker 40 is preferably comprised of a ring marker 40 that frictionally slides up and down along the graduated cylinder 20 as illustrated in FIGS. 1 through 9 and 15 of the drawings. The ring marker 40 further preferably includes a cutout 42 to allow for expansion of the ring marker 40 about the graduated cylinder 20. The marker 40 may also be comprised of an elastic band (e.g. rubber band type of device) tied around the graduated cylinder 20 as shown in FIG. 10 of the drawings. Various other types of markers 40 may be used to visually mark the initial chemical level and/or the final chemical level within the graduated cylinder 20.

F. Support Stand.

A support stand 70 is preferably used with the graduated cylinder 20 to removably receive and support the graduated cylinder 20 after removed from the chemical container 10. The support stand 70 has a base portion 72 and a vertical portion 75 extending upwardly from the base portion 72. The vertical portion 75 is comprised of a tubular structure having an opening slightly larger than the lower end 24 of the graduated cylinder 20. The vertical portion 75 of the support stand 70 is adapted to removably receive the lower end 24 of the graduated cylinder 20. Alternatively, the support stand 70 may be non-removably attached to the graduated cylinder 20 by making the support stand permeable to allow for the liquid chemical 12 to enter the lower end 24 or lower portion of the graduated cylinder 20.

G. Cleaning Device.

FIGS. 11 through 13 illustrate an exemplary cleaning device 60 having a support member 62 and a cleaning grommet 64 defining a cleaning opening 66. The cleaning grommet 64 is comprised of a rubber grommet having the cleaning opening 66 that is adapted to slidably receive an exterior surface of the graduated cylinder 20 to remove residual liquid chemical 12 accumulated on the exterior surface of the graduated cylinder 20. The cleaning device 60 may include a bracket 68 extending from the support member 62 that is attached to the upper portion of the chemical container 10 with a clip device 69 or similar securing device as shown in FIGS. 11 and 12 of the drawings. Alternatively, the cleaning device 60 may be integrally formed within the ceiling 11 of the chemical container 10 as illustrated in FIG. 13 of the drawings. The user inserts the lower end 24 of the graduated cylinder 20 through the cleaning opening 66 of the cleaning device 60 into the chemical container 10 and then when the user removes the graduated cylinder 20 the residual liquid chemical 12 that accumulates on the outside of the graduated cylinder 20 is wiped off by the cleaning grommet 64 to reduce the messiness of using the various embodiments of the present invention. The exterior surface of the graduated cylinder 20 should be smooth to allow for relatively free movement through the cleaning grommet 64.

H. Operation of Preferred Embodiment.

FIGS. 8a through 9b illustrate the general usage of the invention to measure the volume of liquid chemical 12 used

during one or more cycles (or period of time). The user first positions the lower end **24** of the graduated cylinder **20** above a chemical container **10** and then extends downwardly the lower end **24** of the graduated cylinder **20** into the chemical container **10** below an upper surface of the liquid chemical **12** in the chemical container **10** as illustrated in FIGS. **8a** and **8b** of the drawings. If the cleaning device **60** is attached to the chemical container **10**, the user would extend the graduated cylinder **20** downwardly through the cleaning opening **66** within the cleaning grommet **64**. The user allows the liquid chemical **12** to enter the interior of the graduated cylinder **20** through the check valve **56** based on the fluid pressure in the chemical container **10** as illustrated in FIG. **8c** of the drawings. After a minimum volume of liquid chemical **12** enters the graduated cylinder **20** (or the level of liquid chemical **12** in the graduated cylinder **20** is equal to the level of liquid chemical **12** in the chemical container **10**) as shown in FIG. **8d** of the drawings, the user then removes the graduated cylinder **20** from the chemical container **10** as shown in FIG. **8e** of the drawings. If using the cleaning device **60**, the upward movement of the graduated cylinder **20** through the cleaning grommet **64** removes the residual liquid chemical **12** so the residual liquid chemical **12** can remain within the chemical container **10**. The graduated cylinder **20** is then positioned within the support strand to support the graduated cylinder **20** in a vertical manner and the support stand **70** is positioned upon a flat surface such as a table. The user then adjusts a marker **40** upon the exterior of the graduated cylinder **20** to a location adjacent to an initial chemical level in the graduated cylinder **20** as shown in FIG. **9a** of the drawings. The user also inserts the chemical inlet line **14** (normally connected to the chemical container **10**) through the upper opening **23** of the graduated cylinder **20** as shown in FIG. **9a** of the drawings. The chemical inlet line **14** is fluidly connected to a chemical consuming device **16** (e.g. vehicle wash). The user then operates the chemical consuming device **16** one or more cycles (or for a period of time) wherein the chemical consuming device **16** draws at least a portion of the liquid chemical **12** in the graduated cylinder **20** out of the graduated cylinder **20** for consumption by the chemical consuming device **16**. After operating the chemical consuming device **16** one or more cycles (or a period of time), the user then identifies the final chemical level in the graduated cylinder **20** as shown in FIG. **9b** of the drawings. The user also returns the chemical inlet line **14** to be fluidly connected to the chemical container **10**. Based on the difference between initial chemical level (FIG. **9a**) and the final chemical level (FIG. **9b**), the user is then able to calculate a total volume of liquid chemical **12** consumed during the one or more cycles (or period of time). If more than one cycle of the chemical consumer device were ran (e.g. two or more vehicles were washed in a vehicle wash), the user divides the total volume of liquid chemical **12** consumed by the total number of cycles to calculate a cycle volume of liquid chemical **12** consumed by the chemical consuming device **16**. Alternatively, if a period of time was used the user may divide the total volume of liquid chemical **12** consumed by the time period to establish a flowrate (e.g. 5 ml per minute). After the calculations are performed (or at least the final chemical level measurement taken), the user then dispenses any remaining liquid chemical **12** from within the graduated cylinder **20** through the upper opening **23** of the graduated cylinder **20** back into the chemical container **10**. The user then returns the graduated cylinder **20** back to the support stand **70** for later usage or repeats the above process with a different chemical container **10**.

Unless otherwise defined, all technical and scientific terms used herein have the same meaning as commonly understood by one of ordinary skill in the art to which this invention belongs. Although methods and materials similar to or equivalent to those described herein can be used in the practice or testing of the self-filling graduated cylinder system, suitable methods and materials are described above. All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety to the extent allowed by applicable law and regulations. The self-filling graduated cylinder system may be embodied in other specific forms without departing from the spirit or essential attributes thereof, and it is therefore desired that the present embodiment be considered in all respects as illustrative and not restrictive. Any headings utilized within the description are for convenience only and have no legal or limiting effect.

What is claimed is:

1. A method of using a self-filling graduated cylinder for measuring a volume of liquid chemical consumption by a chemical consuming device, comprising:
 - providing a graduated cylinder having an interior, wherein the graduated cylinder is comprised of an elongated structure having an upper end, an upper opening in the upper end, a lower end opposite of the upper end and a check valve attached to the graduated cylinder near the lower end of the graduated cylinder, wherein the graduated cylinder is comprised of a transparent or semi-transparent material, wherein the graduated cylinder includes a plurality of line markings and a plurality of measurement indicia corresponding to the plurality of line markings, wherein the check valve is adapted to allow a liquid chemical to flow upwardly through the check valve into the graduated cylinder, and wherein the check valve is adapted to prevent the liquid chemical within the interior of the graduated cylinder from flowing downwardly through the check valve;
 - positioning the lower end of the graduated cylinder above a chemical container;
 - extending downwardly the lower end of the graduated cylinder into the chemical container below an upper surface of the liquid chemical in the chemical container;
 - allowing the liquid chemical to enter an interior of the graduated cylinder through the check valve;
 - removing the graduated cylinder from the chemical container after a minimum volume of liquid chemical is present in the graduated cylinder;
 - adjusting a marker upon an exterior of the graduated cylinder to a location adjacent to an initial chemical level in the graduated cylinder;
 - inserting a chemical inlet line through the upper opening of the graduated cylinder, wherein the chemical inlet line is fluidly connected to a chemical consuming device;
 - operating the chemical consuming device at least one cycle;
 - identifying a final chemical level in the graduated cylinder after operating the chemical consuming device at least one cycle;
 - calculating a total volume of liquid chemical consumed during the at least one cycle;
 - dividing the total volume of liquid chemical consumed by a total number of cycles of the at least one cycle to calculate a cycle volume of liquid chemical consumed by the chemical consuming device; and

9

dispensing any remaining liquid chemical from within the graduated cylinder through the upper opening of the graduated cylinder back into to the chemical container.

2. The method of claim **1**, wherein the chemical consuming device is comprised of a vehicle wash.
